Measuring the environmental performance of construction materials:

The Green Guide to Specification – Roofing and Hard landscaping

BREEAM Materials, BRE Global

February 2009
Overview

• Sustainability context and buildings
• LCA and Environmental Profiles Methodology
• The Green Guide to Specification
• Use of the Green Guide – BREEAM and The Code
• Impacts of roofing and hard landscaping
Sustainability – Why are we here?
Construction industry and buildings

- Large impacts
  - Construction and demolition waste alone represents **32% of total UK waste** (DEFRA)
  
  - the energy used in constructing, occupying and operating buildings represents approximately **50% of greenhouse gas emissions in the UK.** (Environment Agency 2007)
  
  - Passenger transport vehicles account for a further **15% of CO₂ emissions.** (EST)
Sustainability: How does this apply to buildings?

- Sustainability is a complex & political agenda
- Generally no agreed consensus
- Likely to always change depending upon context
- Lots of Greenwash
- No single tool for measuring sustainability
- Industry using many tools/methods/systems;
  - Life Cycle Assessment (LCA)
  - BREEAM
  - Code for Sustainable Homes (CSH)
  - Carbon Labelling & Footprinting
  - Whole Life Costing (WLC)
  - Environmental Product Declarations (EPD’s)
  - Many others…
Looking at the product level…

How do we measure environmental performance?

Life Cycle Assessment (LCA)
Life Cycle Assessment (LCA)

Extraction

Environmental impacts

Creation

Disposal

Maintenance
How can LCA be used in the Industry?

- To measure existing performance and monitor improvements
- To assess benefits of innovative processes
- To compare materials which offer the similar functions, e.g., external wall constructions
- To compare building designs over their expected lifetimes
- Used in the BRE Environmental Profiles Methodology
What is an Environmental Profile?

Measurement of the *environmental performance* of a material, product or system over a set time period.

- Extraction of raw materials & transport (“cradle to gate”)
- Production (“gate to gate”)
- Transport, installation and end of life (“gate to grave”)

Achieved using Life Cycle Assessment (LCA)

Used in BRE 2007 Environmental Profiles Methodology
  - Level playing field for assessing construction products

Outcome is a Type III Environmental Product Declaration (EPD) compliant with ISO 14025 (externally audited by UKAS)
## Environmental Profiles 2008 Impact categories

Protecting People, Property and the Planet
The Environmental Profile – An independent product declaration

![BRE Environmental Profile](image_url)
BRE Global: Certified Environmental Profiles

- Sister company to BRE (previously BRE Certification)
- Data verification process – evidence
- Supports external claims
- Environmental Profiles valid 3 years
- An independent environmental product declaration

Whole process revolves around:
- Product manufacture data
- Data verification (Factory site audit)
- Data modelling – LCA methodology
What do you do with an Environmental Profile? Comparison at a building element level

Bricks vs bricks

Blocks vs blocks

- 1500+ generic specifications each with summary Ratings
- Ratings A+ to E
- 13 impact category ratings
- Six building types

- FREE access
- Ongoing development
Welcome to The Green Guide to Specification Online

Green Guide online provides designers and specifiers with easy-to-use guidance on how to make the best environmental choices when selecting construction materials and components.

In the Green Guide online, building materials and components are assessed in terms of their environmental impact across their entire life cycle - from 'cradle to grave'. This accessible and reliable information will be of great assistance to all those involved in the design, construction and management of buildings as they work to reduce the environmental burden of their properties.

The specifications shown throughout the Green Guide should not, however, be used as a basis for on-site construction. They are of generic nature only and are used to illustrate a range of typical materials. Although every effort has been made to ensure that the information given here is accurate, our knowledge and understanding continues to evolve. The Green Guide ratings shown here represent our best efforts to provide objective, helpful guidance to enable the specifier to make more informed choices based on the data and methodologies available at this present time.

The Green Guide online has been developed alongside the printed version which will be published later this year. The Green Guide online offers a flexible and adaptable medium and will be updated on a regular basis.
Building Type?

Green Guide 2008 ratings

The Green Guide 2008 ratings can be accessed by following a series of steps to allow you to select the most appropriate range of ratings, starting with the type of building in which the element will sit.

Some ratings apply to more than one building type and this will be stated at element selection stage.

The ratings can be viewed on screen or printed.

Note that ratings are copyright BRE and should not be reproduced in any publicly accessible format without the express permission of BRE. Please email the Green Guide Helpdesk.

Please select a building type

Building type > Domestic
Category > External Wall Construction

External Walls

External wall ratings are the same for the following building types:
Domestic, Health, Commercial, Retail, Industrial, Education

Functional unit for External Walls:
1m² of external wall construction, to satisfy current building regulations, and a U value of 0.3 W/m²K. Where relevant, the specification will also include an internal wall finish.

Variation for retail/industrial
1m² of external wall construction, to satisfy current building regulations, and a U value of 0.3 W/m²K.

Perhaps more than any decision facing the designer, the choice of the external wall specification is subject to the widest range of practical, economic and visual considerations, some of which may be beyond the control of the design team.

External walls can have a significant contribution to the impacts of
Sub-Section of Elements

Please select the element type of External Wall you wish to review:

[Back to BRE]
The Use of the Green Guide to Specification

• Architects and building specifiers

• Part of BRE’s Environmental Assessment Methods for buildings
  – BREEAM & EcoHomes (BRE)
  – Code for Sustainable Homes (BRE & DCLG)
  – Materials specification credits
  – www.breeam.org
What is BREEAM?

- **BRE - Environmental Assessment Method**
- Voluntary Certification scheme for Buildings (but often specified as part of planning)
- Provides an environmental label for buildings
  - Pass, Good, Very Good, Excellent, Outstanding
- Independent & credible
- Holistic and Issue based – broad range of environmental concerns
- Ensures best environmental practice above regulatory minimum
- Large scope – many different types of buildings assessed
- Used mainly in UK but also growing Internationally
The Code for Sustainable Homes

- The Sustainable Buildings Task Group (SBTG)
- Set up by DEFRA, DTI, DCLG, EA, EP and others

- Launched April 2007, revised May 2008
- A single national standard for England
- Based on BREEAM - EcoHomes
  - (replaces EcoHomes in England)

- Mandatory rating for all new homes in England (May 08) and now for Wales too!
Materials Specification

- One of the many issues assessed in BREEAM and The Code
- Credits available - variable
- Whole life environmental impact
- Key building elements assessed
- Green Guide to Specification
  - Ratings A+ to E
  - [www.thegreenguide.org.uk](http://www.thegreenguide.org.uk)
- Higher scores for better rated elements
- Code – Minimum D rated specifications
- Based on LCA and Environmental Profiles Methodology
- Bespoke ratings – Certified Environmental Profiles
How are Roofs and Hard landscaping assessed within BREEAM and The Code?

- Points available within the materials specification credit
  - **Roofs**
  - **Hard landscaping**

Green Guide performance for Roofs

- Roofing specifications vary by building type
- Greater impact for low rise buildings in comparison to high rise buildings
- Different specifications for Domestic, Industrial, Retail, Education and Commercial buildings
- Different ratings depending on pitch of roof and construction
Green Guide performance for Roofs

- Generally...
- Flat roof cold deck - perform well (A+)
  - Timber structures (low climate change impact)
- Flat roof Inverted / warm deck
  - Timber structures - perform well (A and A+)
  - Beam and block, concrete, metal structures - perform poorly (B to E)
    - various different membranes (bitumen, PVC, TPO, asphalt)
    - Paving slabs have higher impact than pebbles
    - Insitu reinforced concrete performs very poorly (mostly D and E)
- Pitched roofs
  - Timber and steel constructions (mostly all achieve A or A+)
Green Guide performance for Hard Landscaping

• Ratings are the same for all building types
• Different ratings dependant upon how trafficked the area is
• Generally:
  – Best performing = concrete paving flags / reclaimed clay pavers with a recycled or no sub-base
    • *Low climate change impacts*
  – Asphalt over recycled sub-base and sandstone / clay pavers perform well
    • *Low water and mineral extraction but high waste disposal*
  – Worst performing = Imported Chinese granite or imported Indian sandstone
    • *High climate change and minerals extraction impacts*
Conclusions

• Sustainability becoming increasingly important for the construction industry

• LCA and Environmental Profiles are tools for assessing environmental performance

• The Green Guide to Specification is a useful tool for architects and specifiers

• Green Guide increasingly being used in the UK due to BREEAM and The Code for Sustainable Homes
