

## Refurbishment and rehabilitation

Redundant industrial and military structures, office blocks and large domestic premises are being converted for a wide range of alternative uses. These buildings offer many challenges to designers, specifiers and contractors - they must be comfortable and energy efficient, adaptable for future technologies and yet retain their original character. We can help you meet these challenges with the following tools

- BREEAM - a world leading method for assessing environmental impact of new and refurbished buildings
- BRE fan assessment: identifies unwanted air leaks in the building envelope
- Calibre - a project management toolkit for monitoring the building process

We can advise on:

- sustainable construction
- waste minimisation
- innovative lighting
- natural ventilation
- general building services
- dynamic loading appraisal/assessment of existing structural elements
- weathertightness testing of replacement elements
- concrete repairs, passivation and cathodic protection
